Skin

red dots - it will be interesting to see, if after the first anti-biotic, if these clear.

dry skin

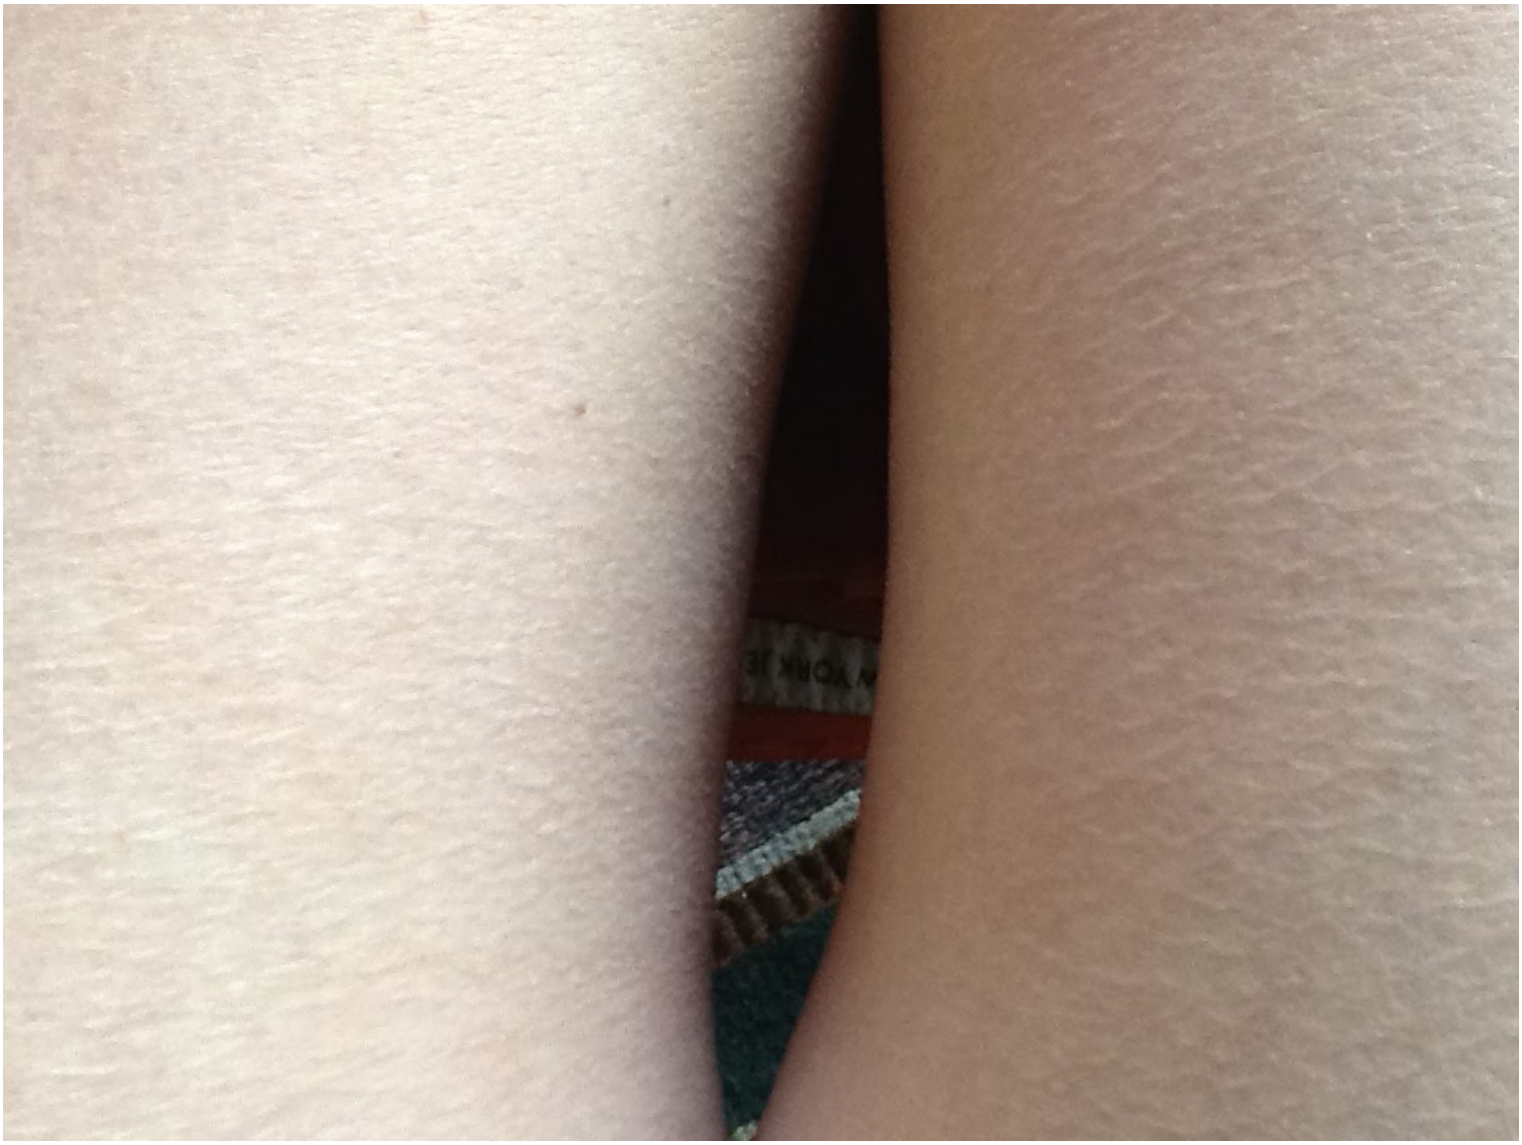
prone to rashes, tinea versicolor

Hives - used to get these frequently in teens, cleared up, on and off over years, seemed more frequent last year.

Recently - developing growths that start small and white, then change color.

Lyme treatment guidelines

"I strongly urge you to biopsy all unexplained skin lesions/rashes and perform PCR and careful histology. You will need to alert the pathologist to look for spirochetes."

http://www.ilads.org/lyme/B_guidelines_12_17_08.pdf


I've always tended towards dry skin, actually, so maybe it is not significant. Perhaps it has to do with my love for dragons - some curious past life. Ha, ha, ha!
